

## Put the Water Cycle in Order

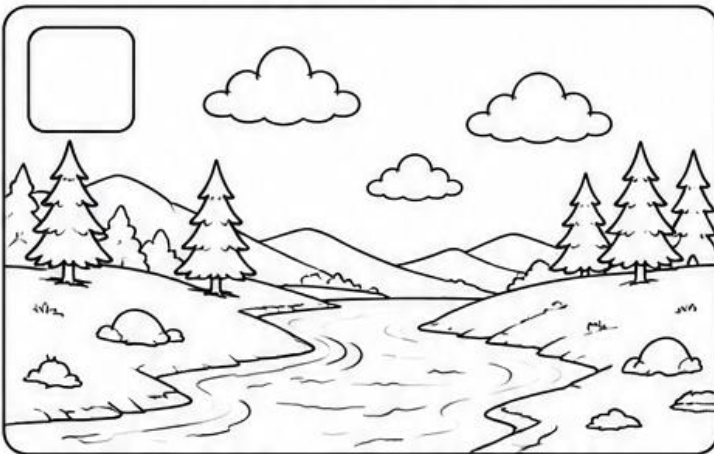

Water moves around earth in a never ending cycle. This is called the water cycle. Look at the pictures below. Number them from 1 to 4 to show the correct order of the water cycle. Color the pictures too.

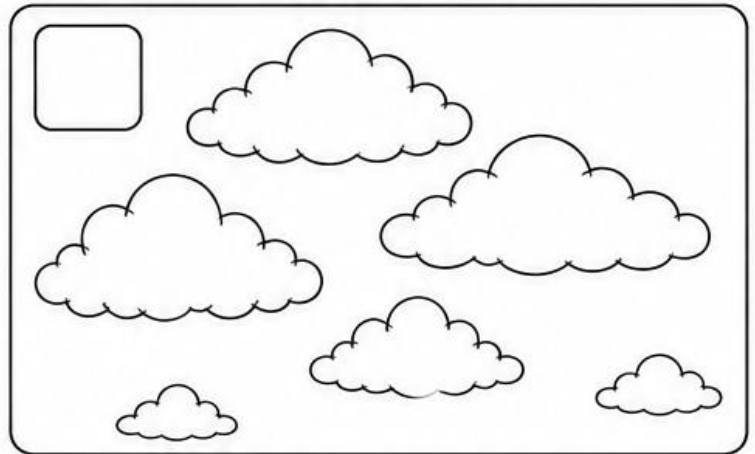

Sun heats the water.  
Water changes to vapor and  
rises into the air.

Clouds get heavy.  
Water falls to Earth as  
rain, snow, sleet, or hail.

Water collects in lakes, rivers,  
oceans, and streams.

Water vapor cools down.  
It changes back to tiny drops  
and forms clouds.
